

The calm AI agent that answers your customers everywhere

Technical Budget Proposal

v1 · Internal · 2026-08-25

Purpose: what the technical stack costs to run build, test, and production frictionlessly. Two phases: 0 clients, and 0+ clients (any number of paying clients).

Pricing references (for the team's own review):

- Public pricing page: convocore.ai/pricing
- Convocore's in-app Billing → Plans screen (our own workspace's real entitlements)

★ **Before finalizing any plan choice below: book a call with Moe Ayman, Convocore's founder.**

Convocore's own support AI directly offered this when asked about our multi-client scaling needs — worth taking them up on it, especially since White Label is now a real \$199+/mo commitment from client 1, not a someday upgrade.

1. The two phases

Phase	What's running
0 clients (build/test)	Claude Pro, Hostinger VPS, Convocore (tier — open decision below), Supabase/Notion/Pinecone free
0+ clients (production)	Same base + Convocore White Label, required from the first paying client (see Section 3 — the single biggest change from earlier drafts)

2. Phase 1 — 0 clients (build/test)

Item	Cost/mo	Notes
Claude Pro	\$20	
Hostinger VPS	\$19.49	srv1881104
Convocore	\$0 or \$59	Open decision — see below
Supabase / Notion / Pinecone	\$0	Free tier — see Section 5
Total	\$39.49–\$98.49/mo	

Open decision — which Convocore tier for build/test

	Free	Pro (\$59/mo)
Pros	\$0 cost pre-revenue	Tests run on GPT-5.6 Luna, the model we actually ship — trustworthy results, real per-conversation cost data
Cons	Free tier can't run Luna at all — findings may not transfer to production. Also a hard 500-credit cap that's one-time, not monthly — a real build/test sprint can burn through it mid-way and stop testing dead until it's gone.	\$59/mo burn with no revenue

Our recommendation: Pro, but only during active build sprints; step down to Free between them. This build-phase question is unaffected by the White Label finding below — testing one agent under one workspace doesn't need multi-client management yet.

3. Phase 2 — 0+ clients (production)

Resolved: White Label is required from the first paying client, not an eventual upgrade

Directly confirmed by Convocore's own support AI (asked specifically about the \$15/mo Client Seat add-on):

“While we don't have a standard '\$15/mo client seat add-on' for the Pro plan in our current self-serve pricing... Our native multi-client management system — which allows you to create separate organizations for each client, manage their individual billing, and control their access from a single dashboard — is a feature exclusive to our White Label and White Label Elite plans. On the Pro plan, the account is designed for a single organization. If you need to manage multiple clients professionally under your own brand, the White Label plans are the intended path.”

This overturns the earlier draft's assumption (a \$15/mo seat stacking on Pro or Business). **There is no per-client add-on path below White Label** — managing more than one client business under one Convocore account requires White Label (\$199/mo) or White Label Elite (\$349/mo), starting with client #1, not at some later client-count threshold.

Base plan for production

	White Label (\$199/mo)
Multi-client management	✓ Separate org + billing per client, one dashboard
Watermark	✓ Removed
Voice	✓ Included (3 Twilio numbers + 10 concurrent call lines bundled)
AI agents	Unlimited
Client sub-accounts included	20 (Client Seat add-on likely covers extra beyond this — confirm with Moe, not independently verified)
Credits/mo	60,000

Business (\$99/mo) and Pro (\$59/mo) are not viable production base plans for Zenny's actual model (one Convocore account serving many separate client businesses) — they cap out at a single organization regardless of price, per Convocore's own confirmation above. Business and Pro's individual features (voice, watermark removal, agent counts) are moot once White Label is the floor, since White Label already includes all of them.

Our recommendation: budget for White Label (\$199/mo) starting with client #1. Talk to Moe before committing — Convocore's own AI flagged this as a “specific scaling needs” conversation worth having, and there may be a custom/negotiated arrangement worth knowing about before locking in list price.

Still to confirm on that call, not resolved by this doc:

- Does the \$15/mo Client Seat add-on apply on top of White Label's 20 included sub-accounts, or is a different mechanism used past 20?
- Is there a lower entry cost for a genuinely small (1–3 client) agency just starting out, or is \$199/mo list price the real floor regardless of scale?

Supabase / Notion / Pinecone: see Section 5 — free tier holds for a real range of production usage, not unconditionally forever.

4. Example monthly cost

One paying client, White Label required for multi-client management:

Item	Cost/mo
Claude Pro	\$20
Hostinger VPS	\$19.49
Convocore White Label	\$199
Total	\$238.49/mo

Up to 20 clients: no further Convocore cost increase (sub-accounts included). Beyond 20, or beyond bundled voice capacity (3 numbers/10 call lines), extra costs apply per the add-on rates in Convocore's pricing table — worth re-confirming with Moe once the roster approaches that range, since exact behavior above the included quota isn't independently verified here.

5. Supabase / Notion / Pinecone at production scale

Free tier is what's running today, sufficient at current (near-zero real client) volume. Whether it holds through real production depends on actual usage against each provider's published free-tier caps — not yet load-tested against real client traffic, so treat the following as trigger points to watch, not a guarantee:

Service	Free-tier cap (published)	Watch for
Supabase	~500MB database, ~1GB file storage, ~5GB bandwidth/mo	DB size or monthly bandwidth approaching the cap as real client data (leads, orders, conversations) accumulates — likely a mid-double-digit-client concern, not a 1st-client one
Notion	Free workspace, API rate-limited (~3 req/sec)	Only relevant if KB sync volume or team collaboration inside Notion itself grows heavy — not driven by client count directly
Pinecone	~2GB storage, ~2M write units/mo, ~1M read units/mo, up to 5 indexes	Write/read units approaching the cap as KB pages × clients × sync frequency grows — first upgrade step if needed is Builder (\$20/mo flat)

Recommendation: stay on free tier for all three now; revisit only when real usage data shows a metric above genuinely approaching its cap.

6. One-time / setup costs

Item	One-time cost
Domain + DNS	Already owned (sunk)
VPS initial setup	Already done (sunk)
Twilio phone number (only if Zenny provisions it, not the client)	~\$1 one-time + ongoing usage — covered by White Label's bundled numbers/lines up to the included quota

7. Decisions needed

1. **Build-phase Convocore tier** — Free or Pro (\$59/mo, sprint-scoped)?
2. **Call with Moe** — book before finalizing; confirm the two open questions in Section 3 (Client Seat mechanics past 20 sub-accounts, and whether a lower-cost entry path exists for a small starting agency).
3. **Production base plan** — resolved: White Label (\$199/mo), required from client #1. Not an open option anymore, pending only the confirmations above.
